Research Assistant, Bioinformatics and Databases Lab

- June 2020

- We develop computational models and automated analysis methods for biological data. Moreover, we develop data mining and management algorithms to automatically predict variety of data pieces in diverse applications that range from predicting students' academic success to classification of living organisms.

DEVELOPMENT EXPERIENCE

Projects

- Present

- *Data Labeling System*: We designed and implemented a Data Labeling System for labeling instances of different datasets using Java. Users can load their datasets in a pre-defined format, and the application exports many useful metrics which helps in understanding the quality of labeled data.
- *Zoom Poll Analyzer*: We designed and implemented a Poll Analysis System for analyzing poll results of Zoom using Python. Users can load their student lists, answer keys and polls based on a pre-defined format. The application exports different statistics and reports ranging from attendance to clustering analysis for cheat detection.

Projects

- June 2020

- *Smart Advisor*: An intelligent web-based agent which uses machine learning to help students predict their letter grades before registering to a course. Instructors can follow their advisees progress and view different statistics of the class. Students can rate their courses and instructors which affects later predictions.
